

DataForms e DataViews

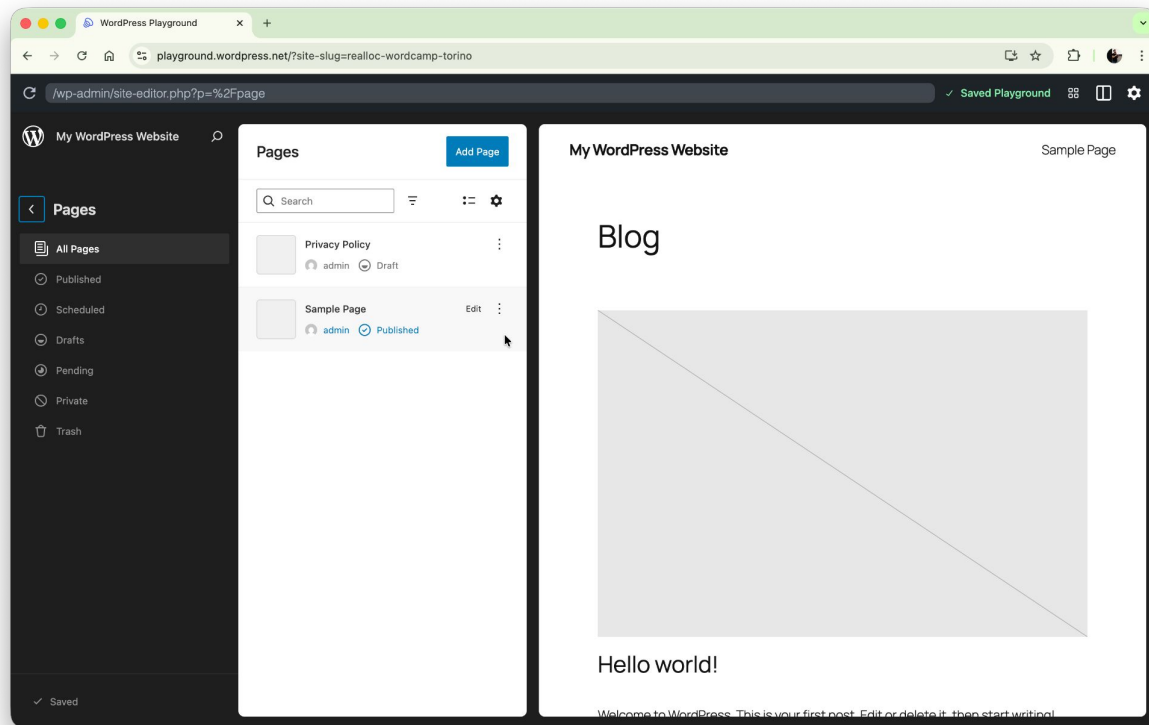

Perché gli sviluppatori di plugin dovrebbero prestare attenzione

DataForms e DataViews

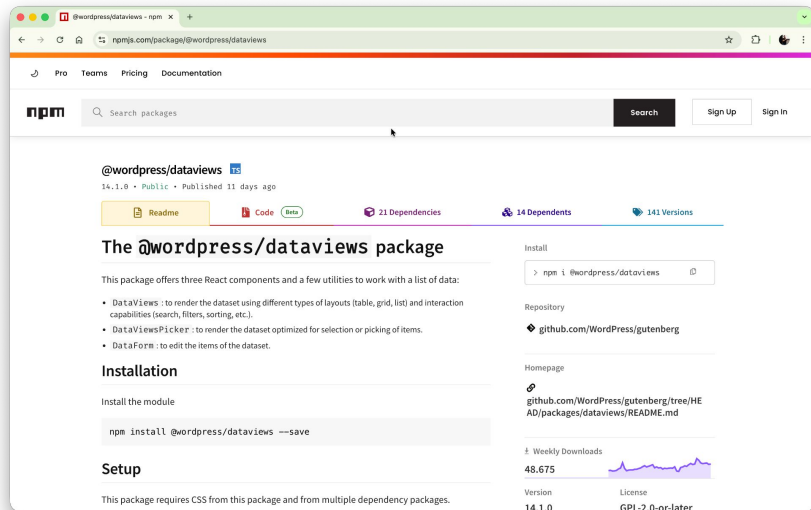

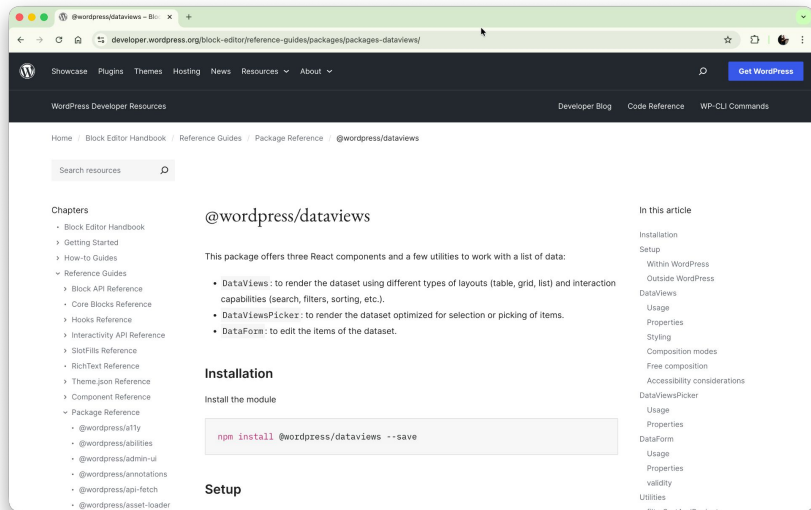

Perché gli sviluppatori di plugin dovrebbero prestare attenzione

Li conosci già

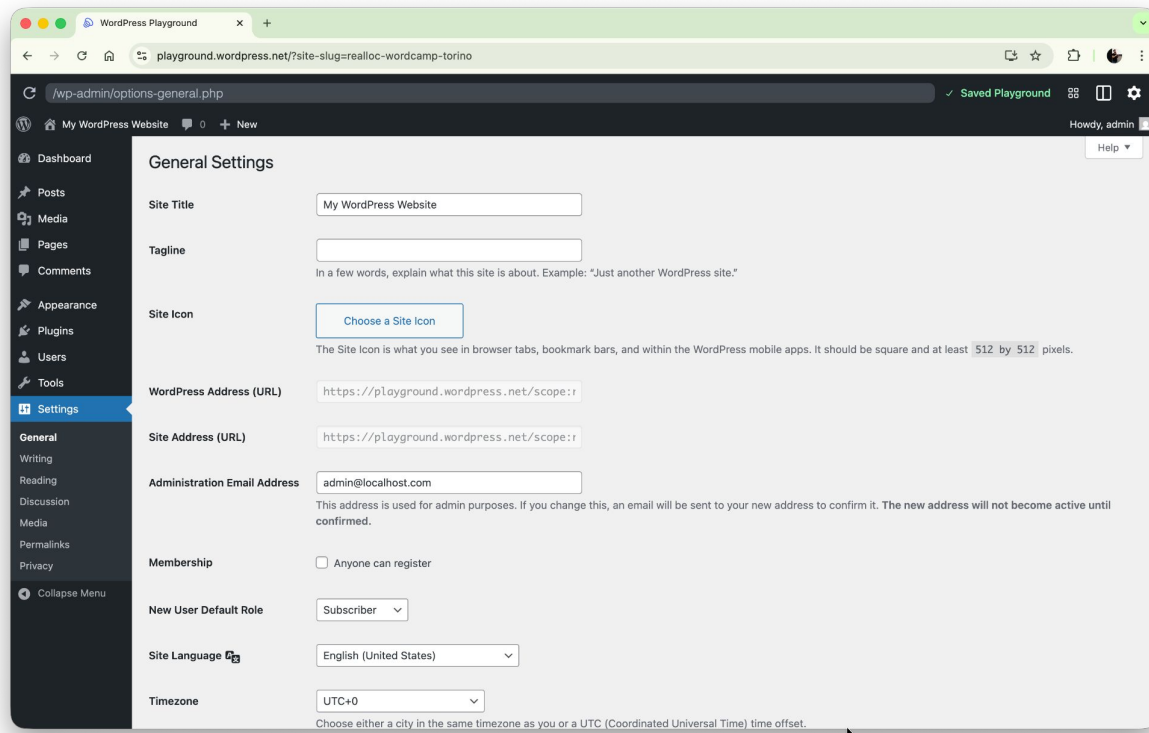

Non sono solo per il Core

@wordpress/dataviews - disponibile per i tuoi plugin

Il problema: le admin page oggi

Riguarda tutti

UX designer, developer, freelance, enterprise

Chiunque tocchi
l'admin di WordPress

Due componenti, un package

- DataViews = mostrare dati
- DataForms = modificare dati
- Stessa architettura `fields`

DataViews: il modello

- `fields` definiscono le colonne
- `view` controlla layout, ricerca, filtri, ordinamento, paginazione

DataViews: layout

Novità 7.0

groupBy e persistenza

Nessun data model incluso

- Tu traduci il `view` state in REST query o `core-data`
- Piccoli dataset: `filterSortAndPaginate`
- Grandi dataset: lato server

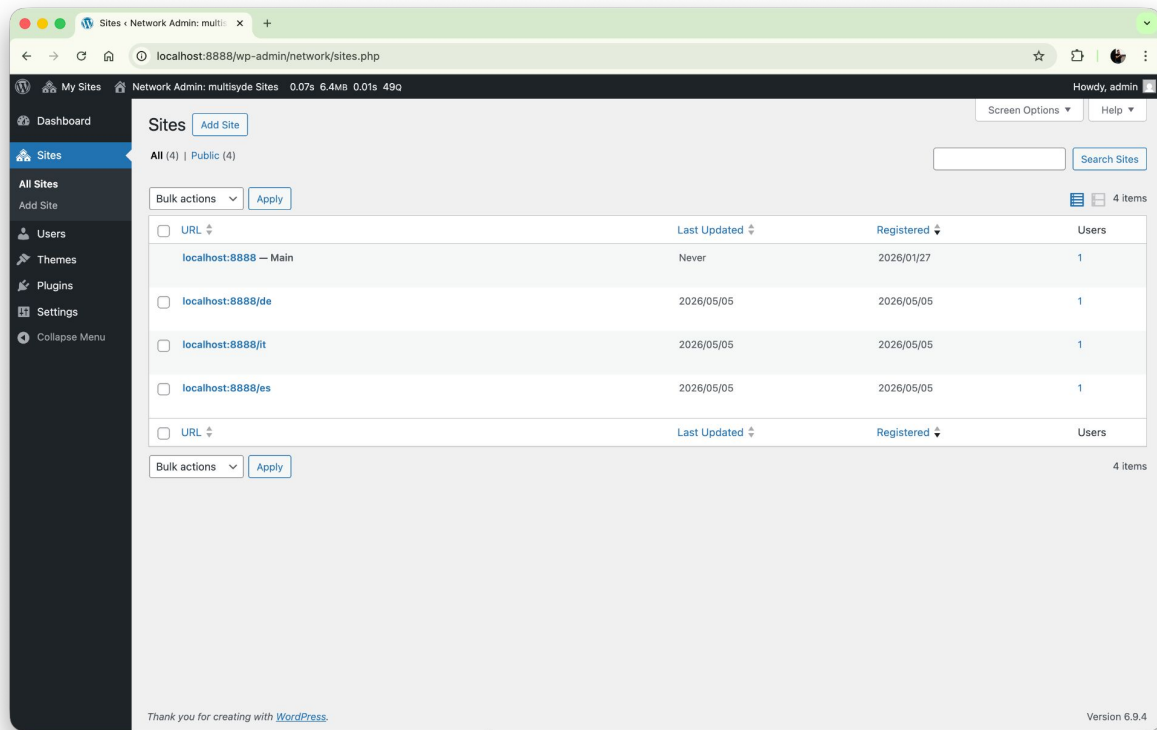

Composizione libera

- `DataViews.Search`
- `DataViews.Filters`
- `DataViews.Layout`
- `DataViews.Pagination`
- `DataViews.ViewConfig`

Arrangiabili liberamente

MultiSyde

Sites oggi

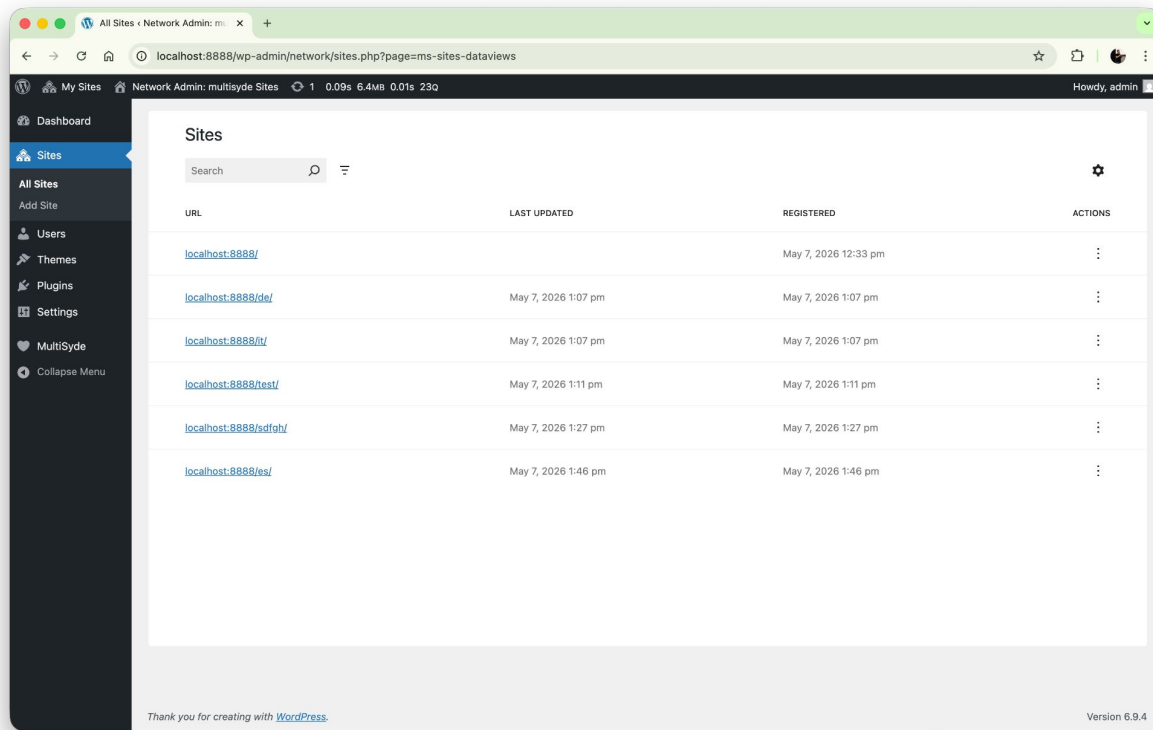

The screenshot shows the WordPress Network Admin interface for a multisite installation. The 'Sites' page displays a list of 4 sites, all of which are public. The table includes columns for URL, Last Updated, Registered, and Users. The first site is 'localhost:8888 — Main', which has never been updated and was registered on 2026/01/27, with 1 user. The other three sites ('localhost:8888/de', 'localhost:8888/it', and 'localhost:8888/es') were all created on 2026/05/05 and each has 1 user. The interface includes a sidebar with navigation links for Dashboard, Sites, All Sites, Add Site, Users, Themes, Plugins, Settings, and Collapse Menu. At the bottom, there is a footer message 'Thank you for creating with WordPress.' and the version number 'Version 6.9.4'.

☐	URL	Last Updated	Registered	Users
☐	localhost:8888 — Main	Never	2026/01/27	1
☐	localhost:8888/de	2026/05/05	2026/05/05	1
☐	localhost:8888/it	2026/05/05	2026/05/05	1
☐	localhost:8888/es	2026/05/05	2026/05/05	1

È i form?

Stessa Field API,
stessa logica –
adesso per
modificare i dati

Settings senza boilerplate

This screenshot shows the 'Settings' page on the WordPress Developer Resources website. The page is titled 'Settings' and has a sub-header 'Overview'. The main content area explains the Settings API, noting it was added in WordPress 2.7 and allows defining settings pages, sections, and fields. It also mentions that new settings pages can be registered with sections and fields inside them. A note at the bottom states that when using the Settings API, the form posts to `wp-admin/options.php` and provides `strict_capabilities` checking. The page is framed by a red border.

Settings

Overview

The **Settings API**, added in [WordPress 2.7](#), allows admin pages containing settings forms to be managed semi-automatically. It lets you define settings pages, sections within those pages and fields within the sections.

New settings pages can be registered along with sections and fields inside them. Existing settings pages can also be added to by registering new settings sections or fields inside of them.

Organizing registration and validation of fields still requires some effort from developers using the Settings API, but avoids a lot of complex debugging of underlying options management.

NOTE: When using the Settings API, the form posts to `wp-admin/options.php` which provides fairly strict capabilities checking. Users will need `manage_options` capability (and in MultiSite will have to be a Super Admin) to submit the form.

This screenshot shows the 'Fields API' page on the WordPress Developer Resources website. The page is titled 'Fields API' and has a sub-header 'The unique identifier of the field.' The main content area explains the Fields API, noting it was added in WordPress 2.7 and allows defining fields within settings pages. It also mentions that new fields can be registered with sections and fields inside them. A note at the bottom states that when using the Fields API, the form posts to `wp-admin/options.php` and provides `strict_capabilities` checking. The page is framed by a green border.

Fields API

The unique identifier of the field.

- Type: `string`.
- Required.

Example:

```
{
  id: 'title',
}
```

type

Field type. One of `text`, `integer`, `number`, `datetime`, `date`, `media`, `boolean`, `email`, `password`, `telephone`, `color`, `url`, `array`.

- Type: `string`.
- Optional.
- By declaring a type, the field gets a default implementation for all the necessary functions (sorting, render, editing, etc.).

Example:

Quattro props

→ data

→ fields

→ form

→ onChange

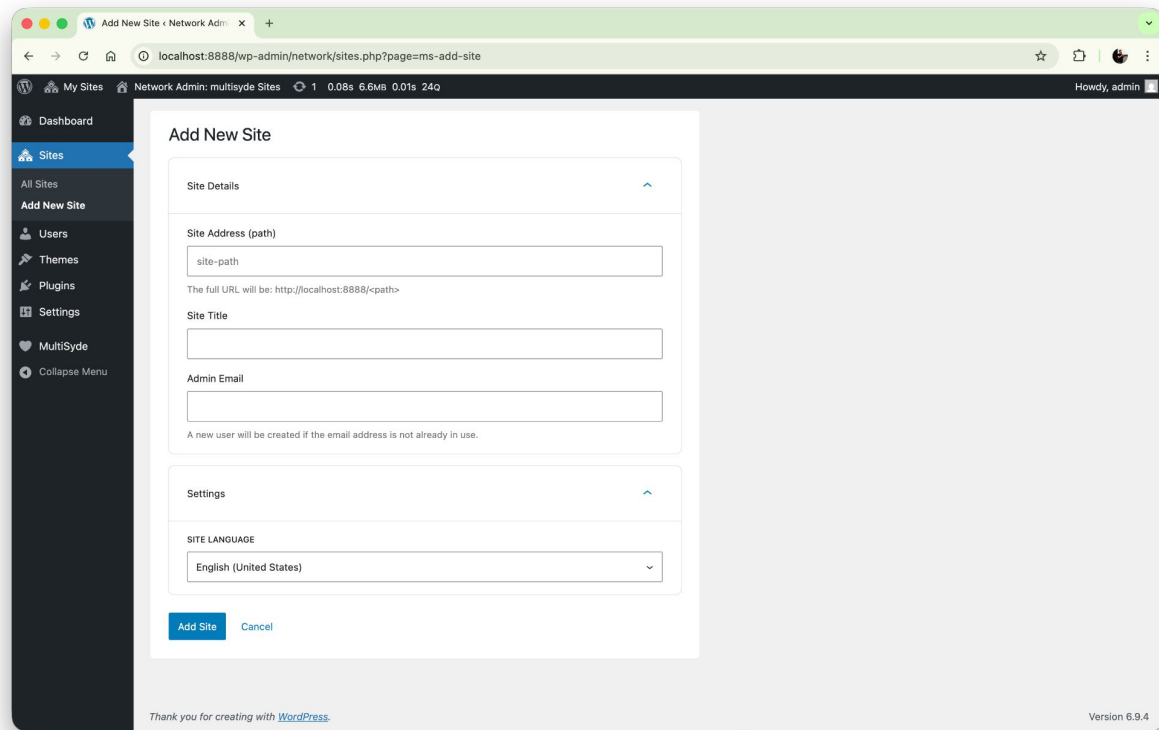

Configurare i fields

- `{ id, label, type }`
- Tipi: `text`, `boolean`, `integer`, `datetime`
- `elements` per select

Scambiare i componenti UI

- La proprietà `Edit: textarea`
- `toggle`
- `toggleGroup`
- `radio` - o componenti custom

Configurare il layout

Validazione nella config

Novità 7.0:

- `pattern`
- `minLength`
- `maxLength`
- `min`
- `max`

meno codice custom

State management

- Un oggetto, non tre `useState`
- `onChange` con spread merge
- Collegamento diretto alla REST API

Architettura a tre livelli

Data provider → Configurazione fields/view → Composizione UI

Una definizione fields per liste e form

Multisite: a cosa fare attenzione

- Network Admin vs Site Admin – separare le view
- Capability mapping per action, non per screen

Quando conviene?

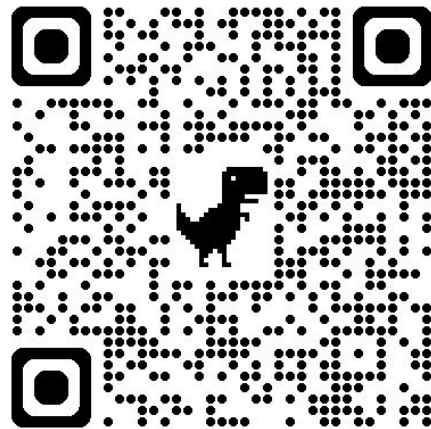

- Nuovo plugin → subito
- Plugin esistente → quando tocchi UX o React
- Multisite → vantaggio enorme

Dalla visione alla pratica

- WCUS 2025: "Multisite ha bisogno di interfacce migliori"
- Oggi gli strumenti ci sono
- 166 contributi, 35 autori nel ciclo 7.0

Domande?

@realloc

Dennis Ploetner

Ho scritto le mie prime righe di codice professionali nel 1997, il che, sì, significa che faccio debugging da più tempo di quanto alcuni dei miei colleghi siano in vita.

Nato in Germania, alla fine ho trovato la mia strada verso l'Italia, dove non ho solo imparato una nuova lingua e sviluppato una seria dipendenza dall'espresso, ma ho riscoperto la mia passione per il web.
